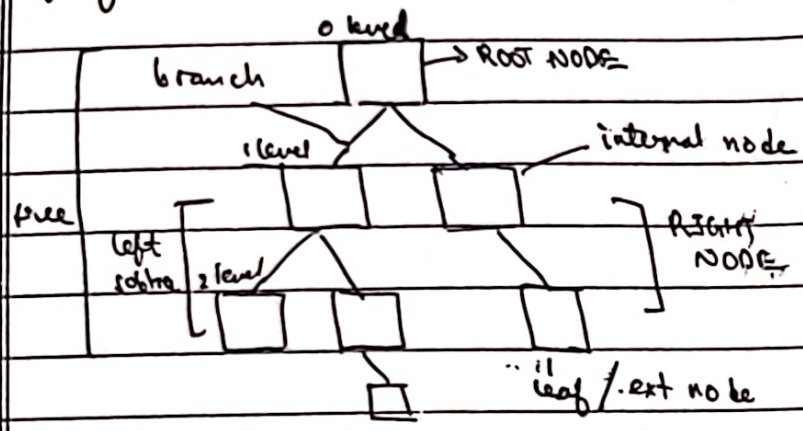
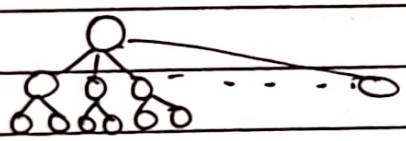
eg of tree → (binary tree)



eg of forest →

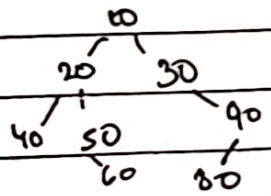


METHODS OF TRAVERSING

1- PRE-ORDER
2- IN ORDER
3- POST-ORDER

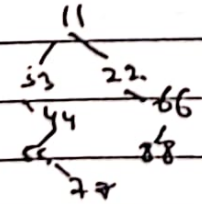
Q- preorder traverse -

(i)



root node 10, 20, 40, 50, 60, 30, 90, 80

(ii)



root node 11, 33, 44, 55, 77, 22, 66, 88

Page No.

Date ___ / ___ / _____

Saathi

Q- Inorder traversal - → necessary to make tree from nodes : give info about left & right subtrees

left subtree — root node — right subtree

i) 40, 20, 50, 60, 10, 30, 80, 90

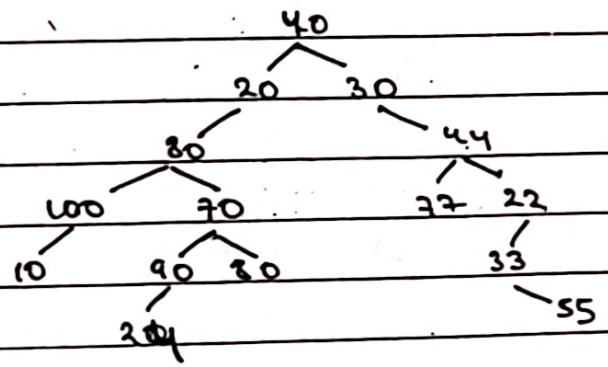
ii) 33, 55, 77, 44, 11, 22, 88, 66

Q- Post order traversal -

i) 40, 60, 50, 20, 80, 90, 80, [10] → root node

ii) 77, 55, 44, 33, 88, 66, 22, [11]

Q-



=> PRT → 40, 20, 80, 100, 10, 70, 90, 24, 80, 30, 44, 77, 22, 33, 55

IN → 100, 10, 80, 24, 90, 70, 80, 20, 40, 30, 77, 44, 33, 55, 22

POST → 10, 100, 24, 90, 80, 70, 80, 20, 77, 55, 33, 22, 44, 30, 40

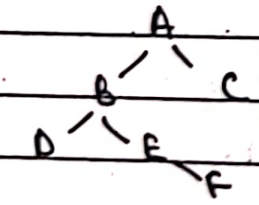
TREE - It is a non-linear data structure. It is mainly used to represent a data with hierarchical representation with records.

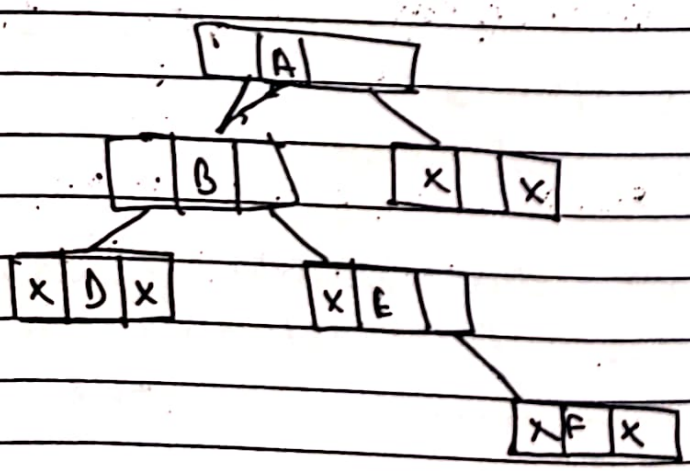
BINARY TREE - (T) - It is defined as a finite set of elements called nodes,

(i) let 'T' be null / empty tree.

(ii) 'T' contains a distinguish node 'R' called root node of 'T' & remaining node of 'T' from an order pair of disjoint trees T_1 & T_2.

→ linked list -





Page No.

(left to right fill)

Date ___/___/_____

Saathi

COMPLETE BINARY TREE - It has at most 2 children, one can show the level 'R' of 'T' can have at most '2^R' nodes.

→ The tree 'T' is said to complete in all levels except possibly the last node possible levels.

→ In complete binary tree left & right children of node 'K' are '2K' & '2K+1' and parent of 'K' is the node 'K/2'

→ The depth of complete binary node

$$D_n = \lfloor \log_2 n + 1 \rfloor$$, n → no of nodes

Height $$= \lfloor \log_2 n \rfloor$$

		L	R
Starts 1	A	2	3
2	B	4	5
3	C	6	8
4	D	x	x
5	E	x	9
6.	F	x	7
7.	G	x	x
8	H	x	x
9	I	x	x

Page No

Applications → mathematical eqn, binary opt.

Saathi

Date __/__/____

EXTENDED BINARY TREE- A binary tree is said to be 2-tree or extended binary tree if each node 'n' has either 0 or 2 children. In such cases, the node with 2 children are called internal node & node with 0 children is called external node.

ALGO FOR PREORDER TRAVERSING →

Date ___ / ___ / _____

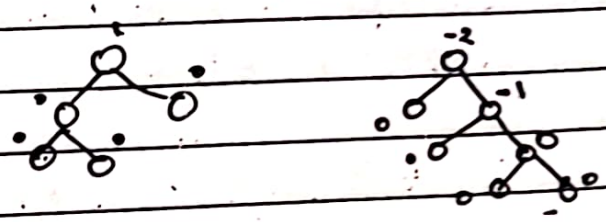
AVL : (BST) (HEIGHT BALANCED TREE)

AVL - balanced binary search tree
(AVL → Adelson Velskii & Landis)

Balanced factor (BF) = $|h_L - h_R|$ $\quad BF \leq 1$

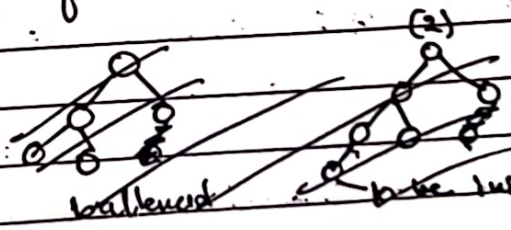
BF = 0, 1, -1 → balanced
→ not balanced

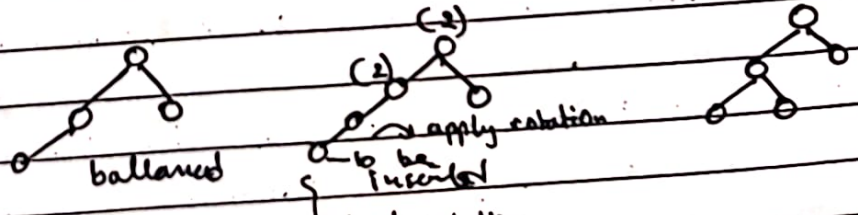
eg



rotations → LL → clockwise dir
→ RR → anti-clockwise dir
→ LR
→ RL

eg of LL →





start rotation from leaf node
if still not balanced get to next node

Page No. ____

Date __/__/____

Saathi

The AVL tree is a BST that has an additional balanced condition. This balanced cond must be maintained in AVL tree.

An empty binary tree B is an AVL tree if the non-empty binary tree with BL & BR are its left & right subtree then tree is AVL tree iff -

(i) BL & BR are AVL trees

(ii) $h_L - h_r \leq 1$ // ballance factor

h_L = height of left sub-tree, h_r = height of right sub-tree

- LL rotation means inserted node is in the left subtree of left subtree of node.
- RR rotation - inserted node is in the right subtree of right subtree of node.
- LR - Inserted node is in the right sub-tree of left subtree of node.

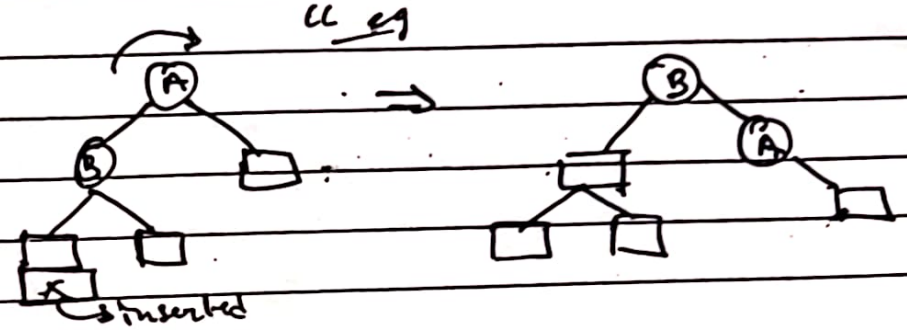
Page No.

Saathi

Date ___ / ___ / _____

- RL - inserted node is in the left subtree of right subtree of node.

eg



\# LL, RR are single rotation
LR, RL are double rotation

- DFS → depth first search // stack used
  BFS → breadth first search // queue used

- The general idea behind the BFS beginning at a starting node A first we examine the starting node A then we examine all the neighbours of A. Then we examine all the neighbour's of the neighbour of A & so no. We need to keep track of the neighbours of a node & we need to guarentee that no node is processed more than once. This is accomplished by using a queue to hold nodes that are waiting to be processed & change the status of the particular node.

Page No.

Date __/__/____

MINIMUM SPANNING TREE (KRUSKAL'S ALGO)

STEP 1- Initially construct a seperate tree for each node in a graph.

STEP 2- Edges are placed in a priority queue, we take edges in ascending order.

(We can use a heap for the priority queue)

STEP 3- Until we have added n-1 edges-

a) Extract the cheapest edge from the queue.

b) If it form a cycle reject it, else add it to the forest.

STEP 4- Whenever we insert an edge, 2 trees will be joined, every step will have joined 2 trees in the ~~forest~~ forest together so that at the end there will be only 1 tree.

eg→

Suppose H is a complete BT with n elements then H is called a heap or max heap if each node n of H has the following property -

(i) The value at n is greater than or equal to the value at each node of children of n.

(ii) for min heap → The value at n is less than or equal to any of the children of n.

INSERTING INTO A HEAP

Suppose H is a heap with n elements & value of info is given, we insert value into the heap H as follows -

(i) adjoin x value at the end of the edge so that H is still a complete BT, but not necessarily a heap.

(ii) Then let value rise to its appropriate place in H so that H is finally a heap.

HASHING (CONTINUED)

3- FOLDING METHOD

eg→ key = abcd → // devide in 2 partition
hash func = ab + cd = x — hash value / जो की index आहे

eg → 1234
12 + 34 = 46
21 + 43 = 64 (ba + dc)
1+2+3+4 = 10 // also valid

COLLISION RESOLUTION TECHNIQUE

1- LINEAR PROBING : h, h+1, h+2, h+3, ...

2- DOUBLE HASHING : combination of 2 - 3 hashing methods is called double hashing methods.

x MID-SQUARE ME - The key is squared, the hash func is defined by H(K) = L where L is obtained by deleting digits from both ends of K^2.

x FOLDING ME - The key K is partitioned into a no. of parts $K_1 - K_r$ where

Page No.

each part except possibly the last has the same no of digits as the required address then the parts are added together ignoring the last carry.

$h(k) = k_1 + k_2 \ldots$

COLLISION RESOLUTION TECH.

2- DOUBLE HASHING - In double hashing, 2nd hash fune h' is used for resolving the collision, $h, h+h', (h+h')+h'$

3- QUADRATIC PROBING - Suppose a record R with key k has the hash address $h(K) = h$, then searching the location with address with $h, h+1, h+4, h+9, h+16 \ldots\ldots$

Q- 23, 45, 43, 67, 66, 54, 65, store in array using div method, with linear prob.

⇒ hash fune ⇒

$H(k) = k \bmod 10$

$23 \bmod 10 = 3$
